Problem 0.1. To see whether a polynomial is irreducible over $\mathbb{Q}$, is it sufficient to test whether $f \mod p$ is irreducible over any prime p?
For example, $x^5 - 5x^3 + 1$.

Proof. Yes. The converse is not true, consider the minimal polynomial for $\sqrt{2} + \sqrt{3}$. □

Problem 0.2. In the above example, how do we know that the Galois group contains an element of order 5? (It is clear why it contains a transposition because there exists complex roots).

Proof. This is because the Galois group G acts transitively on the set of roots, by the Orbit stabilizer theorem, we know

$$|G| = |\text{Orbit}(\alpha)| \cdot |\text{Stab}(\alpha)| = 5 \cdot |\text{Stab}(\alpha)|$$

i.e., 5 divides $|G|$. By Cauchy's theorem, there exists an element of order 5 in G, i.e., a 5-cycle. □

Problem 0.3. The Galois action on the set of roots implies for any root r of the irreducible polynomial (where G is the splitting field of), we must have

$$\text{Orbit}(r) = \{ \text{ set of all roots} \}$$

Proof. Yes, by defiition of a transitive action. □

Problem 0.4. Is it true that if I, J are ideals of a ring R, then

$$\frac{R}{I} \otimes_R \frac{R}{J} = \frac{R}{(I+J)}$$

in the case where $R = \mathbb{Q}[x]$, and I, J are irreducible polynomials, we have

$$\frac{R}{(f)} \otimes_R \frac{R}{(g)} = \frac{R}{(f)+(g)} = \frac{R}{\gcd(f,g)}$$

Problem 0.5. Fall 2014 Q2, $\text{Hom}_R(M, N)$.

Problem 0.6. $\mathbb{Z}/55\mathbb{Z}$.

Proof. We have $n_{11} = 1$, and we can write G as a semidirect product

$$G = \frac{\mathbb{Z}}{11\mathbb{Z}} \rtimes_\theta \frac{\mathbb{Z}}{5\mathbb{Z}}$$

where $\theta : \frac{\mathbb{Z}}{5\mathbb{Z}} \to \left(\frac{\mathbb{Z}}{11\mathbb{Z}}\right)^\times$. We know $\theta(1)$ needs to be sent to an elemennt of order 5, which includes $3, 4$.

$$G = \langle g, h : g^{11} = h^5 = e, hgh^{-1} = g^3 \rangle$$

and

$$G = \langle g, h : g^{11} = h^5 = e, hgh^{-1} = g^4 \rangle$$

□

Problem 0.7. Is cyclotomic extension cyclic.

Problem 0.8. If an intermediate field extension of a Galois extension has order a, $k \subset E \subset K$ has $[E : k] = a$, then the subgroup that fixes E has index a.
