Calc III-Week 10 (10/27-31)

Topics: (1) Divergence and Curl, (2) Double integrals.

Definition 0.1 (divergence). Let F be a vector field in \mathbb{R}^3 $F = (F_1, F_2, F_3)$, the divergence of F is the **scalar field** (assigns one number to an given point (x, y, z)),

$$\operatorname{div} F := \nabla \cdot F = \frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} + \frac{\partial F_3}{\partial z}$$

More generally, if $F = (F_1, \dots, F_n)$ is a vector field on \mathbb{R}^n , its divergence is

$$\operatorname{div} F = \sum_{i=1}^n \frac{\partial F_i}{\partial x_i} = \frac{\partial F_1}{\partial x_1} + \dots + \frac{\partial F_n}{\partial x_n}$$

Remark 1. We write the divergence as $\nabla \cdot F$ because

$$\nabla = \left(\frac{\partial}{\partial x_1}, \dots, \frac{\partial}{\partial x_n} \right)$$

and if $F = (F_1, \dots, F_n)$,

$$\operatorname{div} F = \frac{\partial F_1}{\partial x_1} + \dots + \frac{\partial F_n}{\partial x_n} = \left(\frac{\partial}{\partial x_1}, \dots, \frac{\partial}{\partial x_n} \right) \cdot (F_1, \dots, F_n) = \nabla \cdot F$$

Definition 0.2 (curl). Let F be a vector field in \mathbb{R}^3 , writing $F = (F_1, F_2, F_3)$, the **curl** of F is the vector field

$$\operatorname{curl} F := \nabla \times F = \det \begin{bmatrix} i & j & k \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ F_1 & F_2 & F_3 \end{bmatrix}$$

If $\operatorname{curl} F = 0$, then we say the vector field is **irrotational**.

Proposition 0.1 (gradient is irrotational). Let $f \in C^2$, where $f : \mathbb{R}^3 \rightarrow \mathbb{R}$, viewing ∇f as a vector field, then

$$\nabla \times (\nabla f) = 0$$

Proposition 0.2 (divergence of a curl vanishes). For any C^2 vector field F ,

$$\nabla \cdot (\nabla \times F) = 0$$

Proposition 0.3 (Fubini's Theorem). Let f be a continuous function on a rectangular domain $R = [a, b] \times [c, d]$, then

$$\int_a^b \int_c^d f(x, y) dy dx = \int_c^d \int_a^b f(x, y) dx dy$$

Problem 0.1. Change the order of integration to $dy dx$ for the following function:

$$\int_0^1 \int_{ey}^e \frac{x}{\ln x} dx dy$$

Problem 0.2. Change the order of integrations for the following functions:

1.

$$\int_0^1 \int_x^1 f(x, y) dy dx$$

2.

$$\int_0^1 \int_{-y}^{y^3} f(x, y) dx dy$$

3.

$$\int_0^3 \int_{2x}^6 f(x, y) dy dx$$

4.

$$\int_0^1 \int_{-\sqrt{y}}^{y^2} f(x, y) dx dy$$

5.

$$\int_0^8 \int_{\sqrt[3]{y}}^2 f(x, y) dx dy$$

6.

$$\int_0^1 \int_{\ln y}^1 f(x, y) dx dy$$

Problem 0.3. Show that the vector field $V(x, y, z) = (x^2, -y, z)$ is not the curl of any vector field F . In other words, there is no vector field F such that

$$V = \operatorname{curl} F$$

Problem 0.4 (Marsden-Tromba, IV.4, 21). Let $F(x, y, z) = (x^2, x^2y, z + zx)$.

(a) Verify that $\nabla \cdot (\nabla \times F) = 0$.

(b) Can there exist a function $f : \mathbb{R}^3 \rightarrow \mathbb{R}$ such that $F = \nabla f$.
