Problem 0.1. To see whether a polynomial is irreducible over \mathbb{Q} , is it sufficient to test whether $f \pmod{p}$ is irreducible over any prime p ?

For example, $x^5 - 5x^3 + 1$.

Problem 0.2. In the above example, how do we know that the Galois group contains an element of order 5? (It is clear why it contains a transposition because there exists complex roots).

Proof. This is because the Galois group G acts transitively on the set of roots, by the Orbit stabilizer theorem, we know

$$|G| = |\text{Orbit}(\alpha)| \cdot |\text{Stab}(\alpha)| = 5 \cdot |\text{Stab}(\alpha)|$$

i.e., 5 divides $|G|$. By Cauchy's theorem, there exists an element of order 5 in G , i.e., a 5-cycle. \square

Problem 0.3. The Galois action on the set of roots implies for any root r of the polynomial (where G is the splitting field of), we must have

$$\text{Orbit}(r) = \{ \text{set of all roots} \}$$

Problem 0.4. Is it true that if I, J are ideals of a ring R , then

$$\frac{R}{I} \otimes_R \frac{R}{J} = \frac{R}{(I+J)}$$

in the case where $R = \mathbb{Q}[x]$, and I, J are irreducible polynomials, we have

$$\frac{R}{(f)} \otimes_R \frac{R}{(g)} = \frac{R}{(f)+(g)} = \frac{R}{\gcd(f,g)}$$

Problem 0.5. Fall 2014 Q2, $\text{Hom}_R(M, N)$.

Problem 0.6. $\mathbb{Z}/55\mathbb{Z}$.
